

AI @ W3C

What's Happening?

ICYMI:

- [Web & AI in W3C - TPAC 2025](#)
- [AI & the Web: Understanding and managing the impact of Machine Learning models on the Web](#)

APIs

Web Machine Learning (WebML) Working Group

- [Web Neural Network API \(WebNN\)](#)

GPU for the Web Working Group

- [WebGPU](#)

Web Machine Learning (WebML) Community Group

- [Writing Assistance APIs](#)
- [Proofreader API](#)
- [Translator and Language Detector APIs](#)
- [Prompt API](#)
- [WebMCP](#)

AI Agent Protocol CG

Shout out to IETF work

[AI Preferences \(aipref\)](#) - “The AI Preferences Working Group will standardize building blocks that allow for the expression of preferences about how content is collected and processed for Artificial Intelligence (AI) model development, deployment, and use.”

[Web Bot Auth \(webbotauth\)](#) - “The Web Bot Authentication (webbotauth) Working Group will standardize methods for cryptographically authenticating automated clients and providing additional information about their operators to Web sites. Its products are intended for use by sites that primarily serve human users.”

Interesting questions

- Do the existing web principles need to be adapted to AI, or does AI need to adapt to existing web principles?
 - a. [Ethical Principles for Web Machine Learning](#)
 - b. [Web User Agents](#)
- Will the pressure of OSS AI work make the boundaries between libraries/code and W3C spec more porous?
- How to make sure the "agentic web" is ultimately good for users. Initial list of risks:
 - a. that AI summaries act like candy by being attractive but misleading,
 - b. that they undermine websites' support in various ways. Some of (a) might only happen during the short-term land grab for an oligopoly position, but that can still destroy the norms needed for a commons to work.
